25X1

1. The low-grade tin ore mined at Altenberg in the Erzgebirge Mts has an average Sn content of about 0.2 percent. It is of great importance therefore that good tin finds with an Sn content of 0.3 to 0.4 percent have been struck near Rodewitsch and Zschorlau in the Vogtland.
2. The wet-dressing of low-grade tin ore had a low output of only 50 percent because of the necessary extensive decomposition. A flotation process was developed in Freiberg in Saxony which resulted in an output of 80 percent. Such a flotation plant was installed in Altenberg in 1943, but Wernicke (fnu), chief inspector of mines, brought about the dismantling of this plan before it was put into operation. The wet-dressing plant in Altenberg, which is believed to be still in operation, is planned to be replaced by a flotation plant.
